

# PATRIOT Deployment

NATO has been augmenting Turkey's defence capabilities since January 2013.

In response to Turkey's request, NATO Foreign Ministers decided on 4 December 2012 that NATO would augment Turkey's air defence capabilities in order to defend the population and territory of Turkey against threats posed by missiles from across its border with Syria.

Allies have committed five PATRIOT batteries to augment Turkey's air defences. Germany and the United States have provided two batteries each since January 2013. Spain has provided one since January 2015. There are approximately 750 NATO troops supporting the Patriot deployment. The Netherlands provided two batteries from January 2013 until January 2015.

All PATRIOT batteries are under NATO command and plugged into NATO's air defence network. Command and control procedures have been agreed by all 28 Allies. NATO's Supreme Allied Commander, General Breedlove, has operational command responsibility for the Patriot deployment. He has delegated responsibility to Allied Air Command, Ramstein, which is in charge of NATO's air defence, and to NATO military commanders on the ground.

The first battery became operational under NATO command on 26 January 2013.

NATO Secretary General Jens Stoltenberg visits the US PATRIOT deployment at Gaziantep on 10 October 2014

## PATRIOT Missiles Overview

The PATRIOT is a surface-to-air guided air and missile defence system currently in use world-wide including in several NATO countries (Germany, Greece, the Netherlands, Spain and the United States). PATRIOT stands for "Phased Array Tracking Radar to Intercept on Target".

The Syrian regime has used and continues to use ballistic missiles. Since 2012 we have detected several hundred ballistic missile launches within Syria. This emphasizes the need for effective defence of our Ally Turkey.

## History

The first PATRIOT air defence systems were deployed by U.S. Forces in the mid-1980s. During the first Gulf War, it was used to defend against the Iraqi Scud missile threat. The PATRIOT system has evolved over the years as the threat has changed and technology has advanced. The current PATRIOT variants are equipped with advanced interceptor missiles and high performance radar systems.

## Role

The role of the PATRIOT is to defend Turkey against the threat posed by Syrian Ballistic Missiles. Notable characteristics of the PATRIOT system include a short response time, the ability to engage multiple targets simultaneously, good ground mobility, and the ability to resist electronic jamming.

## System Description

PATRIOT systems have four operational functions: communications, command and control, radar surveillance and missile (interceptor) guidance.

A battery has six major components: a power plant, radar set, an engagement control station, launcher stations, the antenna mast group, and the interceptor missiles themselves.

- The Radar Set provides detection and tracking of targets as well as fire control. The phased array radar helps guide interceptors to their targets and is resistant to jamming.
- The Engagement Control Station calculates trajectories for interceptors and controls the launching sequence. It communicates with the launcher stations and other PATRIOT batteries. It is the only manned station in a PATRIOT fire unit.
- The Launcher Stations transport and protect the interceptor missiles and provide the platform for the physical launch of the missile.
- The Antenna Mast Group is the main communications backbone for the PATRIOT unit.
- The Interceptor Missiles: PAC-2 is a proximity fusing missile, whereas PAC-3 has been specifically designed to intercept and destroy missiles by impacting them directly with kinetic energy - "Hit-to-Kill" technology.

## Target Engagement

Once the PATRIOT missile is launched, it is tracked by the phased array radar set. As the interceptor missile approaches the target, its active seeker will steer the missile to the target. A PAC-2 Patriot missile will detonate in the vicinity of the threat missile whereas a PAC-3 will seek to impact the warhead of the threat ballistic missile.

## Specifications

Variant: PAC-2 and PAC-3

Defended area: 15-20 Km against ballistic missiles

Missiles per launching station: 4 PAC-2, 16 PAC-3

Radar Range: 150+ Km

Speed: 5,000 Km/h

Flight Ceiling: 20+ Km

Missile Length: 5.2 m

Diameter: 25 cm

Weight: 320 Kg

## PATRIOT Deployment Locations

Spain: Adana

Germany: Kahramanmaras

US: Gaziantep
